Mind Over Matter Final

I'm keeping this short, sweet, and informal. I've worked in excess of 300 hours for this project. What started as a simple HTML 5, CSS, and Javascript site, turned into a near fully - functional Laravel application. I've almost learned too much.

You asked me to add relevant I.E.E citations. This project was ported to a laravel/laravel template with the composer create-project laravel/laravel <project-name> command. So, most of the files are inherent to the framework itself.

I implore you to seek the changes made in the following directories: pretty much everything inside resources/, all models (except the inherent User.php) inside app/Http/Models, all routes within the routes/web.php file, pretty much everything inside databases/, and several files within the app/Http/Controllers directory.

The configuration file for Vite/ Vite Mix is inside the root directory, called vite.config.js. Any assets inside resources/ are minified, bundled, and compiled with the command npm run build. This builds an optimized codebase that the application actually runs off of from inside the public/build directory.

You asked us to implement security. There are several features already inherent to laravel that I won't go over here. I will instead refer you to the README.md. I highly recommend you read it.
